Shower Infrastructure

- Showermate easily attaches to any user’s existing shower infrastructure by connecting to the standardized shower arm.
- Users are still able to manually adjust their shower experience as desired with existing handles. The embedded sensors and algorithms will track these changes to update user preferences.

Greywater Infrastructure

- Homeowners are able to modify their plumbing system to divert shower greywater from other plumbing to a sprinkler system for a guilt-free shower experience. Showermate’s sensors also track how much greywater was produced for reuse and displays this for the user.
- Greywater usage is a more sustainable alternative than fake lawns.

Internet Infrastructure

- Users login to their personal account to activate the Showermate shower head to keep track of water usage and user preferences.
- Data is sent back and forth via bluetooth from the mobile app and Showermate shower head.
- User data is stored in a server that can be personally accessed or accumulated and displayed on the company webpage as aggregated data for interested stakeholders.
